## Passage - 2

The entropies of methyl chloride and hydrogen are plotted as a function of temperature from OK to 300K. Data are for molar quantities. The phase present at various temperature are noted. The first vertical line segment on each graph represents fusion (s) $+(\ell)$ the second represents vaporization $(\ell)+(\mathrm{g})$.

3. The entropy of methyl chloride is more than hydrogen due to:
a. molecular mass of $\mathrm{CH}_{3} \mathrm{Cl}$ is more than $\mathrm{H}_{2}$
b. $\mathrm{H}_{2}$ has more vibrational mode than $\mathrm{CH}_{3} \mathrm{Cl}$
c. $\mathrm{CH}_{3} \mathrm{Cl}$ has more vibrational mode than $\mathrm{H}_{2}$
d. None of these

C
Sol. It is clear from the plot that at low temperatures entropy of hydrogen is higher than methyl chloride. As temperature decreases vibrations decrease. It follows that the higher entropy of $\mathrm{CH}_{3} \mathrm{Cl}$ is due to vibrational modes.

a. It is an extensive property
b. It is an intensive property
c. It depends on molecularity of compound
